StreamWebs Field and Classroom Watershed Investigation Curriculum

Unit Overview

The unit is designed for 6th–9th grade but may be adapted for older or younger grade levels.

The StreamWebs Field and Classroom Watershed Investigation curriculum is designed to help formal and nonformal educators use StreamWebs as a platform to conduct meaningful field-based student driven investigations that continue in the classroom. The desired outcomes are to provide science inquiry based opportunities for students to work collaboratively in the field in ways similar to scientists; to understand that science doesn’t only happen in a lab or classroom; to design their own investigative question and research plan; to collect data; to teach them how to look for patterns and changes in their data; to make logical conclusions based upon their data; answer or refine their investigative question and/or research plan; and understand what the data indicates for their stream over time.

Students will get to know their watershed, choose a local stream to study, and identify and work with partners that can support their project. The lessons may lead you and your class towards designing and implementing a stewardship project, but focus on field research and engaging students in their environment through inquiry and student-driven projects. Students will research and their watershed, design investigative questions, plan and conduct an investigation, and collect, analyze, interpret, and present data. StreamWebs has many potential protocols for collecting stream data, but these lessons focus on water quality and macroinvertebrate data. These lessons will achieve cross-curricular connections between math, language arts, and science as students develop their data literacy.

Lessons are aligned with the Next Generation Science Standards (NGSS): Each lesson will describe the corresponding Middle School (MS) Performance Expectation and Science and Engineering Practice(s) that connect to those lessons.
Lesson 1

Timeframe
1-2 Fifty minute class periods, depending on how much students know about watersheds.

Materials
- Maps of the watershed (if you have them or are able to get them from a partner, otherwise Google Earth is a great alternative)
- Computers or tablets (one per group)
- Pictures of local bodies of water
- 3x5 index cards

Objectives
- Work and collaborate together in groups
- Learn about watersheds and identify their own local stream or river
- Understand where a particular stream’s water starts from, and where it flows to
- Research the local needs of their community and watershed

Discover Your Watershed

Teacher Background

This lesson is meant to prepare prepare students for an upcoming field experience through introducing them to the field site they will visit and helping them determine their research interests. Whether students are doing a single field trip or multiple trips we encourage you to use the opportunity for students to develop and answer an investigative question through the data that they collect. A great resource to help you develop an investigative question with students is “Field Investigations: Using the Outdoor Environments to Foster Student Learning of Scientific Processes”

There are most likely some organizations in your community that do work to protect, monitor, and care for your watershed. This is a great time to invite them in to talk with your students about their local watershed before you go out. Staff might also be available to assist your students during their field trip or to provide other field resources such as equipment. Suggested organizations to reach out to include: watershed councils, city parks, or other city/state departments tracking stream health such as: transportation departments, state parks (if nearby), the Bureau of Land Management, Oregon Department of Forestry, the United States Forest Service, private agricultural or forestry businesses within the community (for example: Starker Forest in the Corvallis area), and nonprofits such as friends groups caring for a particular park or stream.
Description
In this lesson students will be introduced to the concepts of a watershed, and learn about their own watershed. Students will use Google Earth to get to know their local watershed, and to identify features of a watershed. Students will begin to understand what scientists study in a watershed, identify their own interests about the watershed, and discover community partners they might work with during a field investigation.

Preparation
Teachers will need to spend time researching the watershed you will work with, and familiarize yourself with the headwaters (where a stream begins), mouth (where it meets and flows into another body of water, such as another stream or the ocean), and other important features (such as incoming streams or dams) along the stream you are studying with students. If you haven’t already used Google Earth you will want to spend some time becoming familiar with it and identifying the key features of your watershed that you would like to point out. You can download Google Earth at https://www.google.com/earth/

If you have not talked about watersheds with your class previously you may want to do a lesson that provides a basic introduction before beginning this lesson. This would also be a great time to bring in someone from your local watershed council to come and do a watershed-based activity with your class.

Activity Introduction
Explain to students that they will be learning about their local watershed, understanding our role within a watershed, and discovering the needs of their watershed. Explain that they will eventually work in teams to design a field investigation that they can do in their watershed.

Discuss the following as a class:

- We depend upon our natural resources for our health and needs such as: clean air, food, and clean water.
- We monitor our resources such as streams, to better understand the health of our resources.
- We will be planning an investigation in teams as a way to study and learn more about our local community, identify the needs of our local watershed, and discover what sort of work is done to maintain a healthy stream and watershed.

Next Generation Science Standards

DISCIPLINARY CORE IDEAS:
LS2.A: Interdependent Relationships in Ecosystems
ESS3.C: ESS3.A: Natural Resources

PERFORMANCE EXPECTATIONS:
MS–LS2–4. Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations.
MS–ESS3–1. Construct a scientific explanation based on evidence for how the uneven distributions of Earth’s mineral, energy, and groundwater resources are the result of past and current geoscience processes

PRACTICES:
Practice 1: Asking Questions and Defining Problems
Part 1: What Does Your Watershed Need

1. Using google earth, project your watershed at the front of the class, or assist students in navigating Google Earth to find their watershed. If you are using Google Maps, open and select the Terrain or Satellite view. Type into the Search box the locations you are interested in exploring (i.e. your school’s address, a local creek, etc.) or click on the map to select each.

2. Save each location and once you have the map locations, explore. Zoom in and out; use Street view and Photos to virtually visit each site. Point out landmarks such as schools, grocery stores, restaurants, and parks to give students a better sense of place.

3. As a class, identify the following characteristics and discuss:
   - What do you notice about our watershed? Where does our stream start?
   - Where does the water travel before entering the stream? *Over land, soil, rock, or pavement, and/or through the ground.*
   - Where does the water from that stream or river go? *To a bigger stream or river, to a lake, and/or to the ocean.*
   - What does it mean for a watershed to be healthy? *Elements include: correct temperature and chemical properties, low levels of incoming tree and plant coverage for habitat and for filtering/slowing water, low bank erosion, low levels of invasive species, etc. All of these attributes affect our drinking water.*
   - Who and what lives in a watershed? *People, fish, birds, our pets, deer and other wildlife.* Point out to students that other living and nonliving things including buildings, rocks, soil, trees, and plants all ‘live’ in our watershed. Even your school and your house are part of your watershed.
   - How do we impact our watershed? *Recreation such as hiking, fishing or camping, not properly disposing of pet waste or garbage, washing their car in the driveway or allowing other pollutants to run into the street and/or storm drains, allowing invasive species to grow in their yard, etc. There are also a number of ways that we can positively impact our watershed such as removing invasive species and/or planting native plants.*

Guiding Questions

- What is a watershed? Which one do we live in?
- What local stream or river do we live close to?
Part 1: Continued

4. Start talking about potential places where students could collect data and/or conduct a field investigation, work as a class to help students to identify:
   • a nearby stream, river, lake, etc. where there is enough standing water for students to be able to collect data.
   • potential areas where they could collect their data for a field investigation.

5. Let students know that they will be going out into the watershed to learn more about it! Ask them to think about what interests them most and give them a minute to jot down the top three things that they want to investigate and learn while you are in the field. Note: You will want to consider which tools you have, and the site you will be investigating so you may want to provide some parameters to students.

6. Have students share their interests with a partner and then with the larger class. As students share record topics and possible investigative questions on the board.

7. Hand out 3x5 cards and ask students to write down their top three interests or questions on the card. Use these cards to arrange students into groups based upon their interests or to develop a class research question.

8. If you are able to have students work in teams by interest you will need time to arrange student research teams before moving on to Part 2. If you aren’t able to have students work on separate projects you can use their ideas to come up with research question that the entire class can investigate.
Part 2: Developing an Investigative Question

1. Let students know that before heading into the field, scientists know what they are looking to discover based upon an investigative research question that they are trying to answer, or a problem they are trying to solve. Have students discuss (in groups or as a class) what they were interested in studying.
   - What interests do they all share?
   - What questions about the stream or watershed do they have in common?
   - What is one thing that they could focus on together to study in the stream?

2. Now that students have an area of interest, walk them through the process of developing a good investigative question. Tell students that they may refine their questions throughout the research process. Scientists are always learning and refining their questions and studies.

3. Have students discuss and follow these guidelines when creating a good investigative question:
   - Cannot be answered with a simple yes or no
   - Needs to be interesting to you
   - Must be able to measure/study within our timeframe and with our tools
   - Starts with words like:
     How does...
     What is...
     Would x affect y...

4. Share examples of investigative questions and then have students work in teams to create an investigative question that their team will study or generate one question that the larger class will study. Example questions might include:
   - What is in our water and how might it have gotten there?
   - What is our creek’s amount of tolerant or intolerant macroinvertebrate species compared to other creek’s?
• How much does the water temperature drop during winter?
• Is this creek healthy for the fish who live here?

Part 2: Continued

5. Have each team share their investigative question(s) with the class. Will they be able to answer it with the tools and within the time allotted to your field investigation? Does it make sense for the watershed you are working in? If not, how can they change it?

6. After students have finalized questions discuss how scientists often create an investigative plan to outline how they will conduct research to generate data. Students might document in a notebook logical steps written clearly so that someone else could follow the procedure. *What data will they collect? Which tools will they use? What part of the watershed will they study? How much data will they collect? Etc.*

Activity Wrap Up:
Review with students what they will be studying when they head into the field. Assure them that through experience of getting out into the field and investigating their watershed they will learn what to write down, and become more comfortable recording field observations such as specifics about: what you see, hear, smell, do, and the data collected. Let students know that in the next lesson they will have the opportunity to learn more about the resources that they will be using to collect data and study their watershed.

Extended Learning

Looking for lessons that will introduce students to watershed?

Check out “Home, Home in a Stream”, an activity compiled by Oregon State University’s Science Math Investigative Learning Experiences (SMILE) Program or “Crumple a Watershed”, from Oregon Museum of Science and Industry (OMSI)!
Lesson 2

Getting Ready for the Field

Teacher Background

For information on water quality and macroinvertebrates refer to:

“Water Quality and Macroinvertebrate Field Studies; found in “Resources” section for individual Kits: http://seagrant.oregonstate.edu/education/streamwebs-educator-kits/streamwebs-kit-descriptions

For information on setting up an account and getting started using the StreamWebs database refer to the sheet “Getting to know StreamWebs”.

Description

In this lesson students will learn about the research tools available to them for collecting data, how scientists monitor water quality health, and the online resource www.streamwebs.org for storing data. After students have a better understanding of the resources available to them they will work on creating an investigative research question.

Preparation

Create a StreamWebs account ahead of time to share with your class. It is recommended that you share one account as a class.

1. Go to www.streamwebs.org; “Create New Account”. It is recommended that you make one account that your class can login to so be sure to choose a user name and password that you will be comfortable sharing with students.

2. If there is an existing project site that you plan to work at you can locate it by selecting “Search Projects” from the menu. Sites are found by using the search bar and on the map by colored “pegs”.

www.streamwebs.org
Preparation cont.

3. If you need to create a project site select “Add Project” from the menu and enter in the information about your project site. Obtain sampling tools that will be available for students to use as part of their investigation. Equipment is available to borrow through www.streamwebs.org or you can reach out to your local watershed council, STEM hub, etc.

Make macroinvertebrate card packets for students to practice identification using the pictures found in the “Macro Mayhem” lesson developed by Minnesota DNR. You will divide students into 4-5 groups and need one packet per group. You will also need to set up “stations” with sample water that will allow students to practice collecting data with their equipment. You should label stations as different parts of the watershed such as urban, rural, estuary, or upstream, downstream, etc. You could also provide each group of students with their own “set” of samples rather than rotating. If you are not able to collect a variety of water samples to show variation you will want to adjust your water accordingly. In order to get a good variety of pH readings, you can add lemon at one station, baking soda to another, coffee to another, etc. Add mud or debris to demonstrate turbidity and hot and cold water for measuring temperature and dissolved oxygen, etc.

Activity Introduction

Explain to students that they will practice using sampling tools that help determine if a stream is healthy. They will specifically be learning about the different water quality parameters and macroinvertebrate species that are commonly used to measure stream health.

Part 1: Understanding Water Chemistry

1. Ask students what we can learn by studying the water quality and macroinvertebrates in our watershed? About the health of our watershed.

2. What are some ways that scientists determine if a stream is healthy or unhealthy? They do different tests to look at temp, oxygen in water, sediment in water, etc.

3. Discuss stream temperature, dissolved oxygen, turbidity, and pH and what they measure and tell us about the water. Provide students with water quality parameters sheets included in lesson.

4. Ask students to break into pairs or small groups. Let them know

Next Generation Science Standards

DISCIPLINARY CORE IDEAS:

LS2.A: Interdependent Relationships in Ecosystems

ESS3.C: Human impacts on Earth Systems

PERFORMANCE EXPECTATIONS:

MS–ESS3–3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.

MS–LS2–1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

MS–LS2–2. Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

PRACTICES:

Practice 1: Asking Questions and Defining Problems

Practice 3: Planning and Carrying out Investigations
Preparation cont.

that they are going to do an inquiry activity to get to know the tools that they are going to work with in the field.

5. Pass out field equipment to students and have them discuss: what is it? what is it used for? how does it work? What might this tool tell you about a water sample? How do you know? What is your evidence?

6. Pass out StreamWebs water quality data sheets to student teams and use the Guiding Questions to help students understand the importance of data collection.

7. Have students rotate through the water quality sample stations and use their equipment to collect water quality data. Remind them to record all of the required information on the datasheet.

8. When students have finished collecting their data have them report out their findings.

Part 2: Understanding Macroinvertebrates

1. Tell students that scientists also use macroinvertebrates the live in the water to determine how healthy it is.

2. Define with the class what the word macroinvertebrate means. Break it up into macro (large enough for us to see with our naked eye) and invertebrate (without a backbone).

3. Explain how macroinvertebrates living in a stream can be an indicator for water quality.

4. Hand out a packet of macroinvertebrate cards to each group. Ask students what they notice about their macroinvertebrates that might help us tell them apart?

5. Explain that macroinvertebrates are grouped by characteristics similar to the ideas students just discussed. Some of these characteristics include: size and shape of their body, legs, eyes and mouth if visible, and where they are found in the stream. Now have them sort their macroinvertebrates based on some these things that they notice about them.

Guiding Questions

- **What is data?** Facts and information gathered from observation. Data can be numbers, words, sketches, and drawings—all of the things we just collected with our tools.

- **Why is it important to collect data?** Data is part of the scientific method—explain if a new idea to students. Data helps scientists to gain understanding about the natural world, identify patterns and correlations, answer questions, and make conclusions.

- **Why is it important to record data accurately and neatly?** Data is often input into a database, such as StreamWebs, or a spreadsheet once it is collected. It is important to be able to read what you have recorded so that it can be input later. Common errors such as bad handwriting, no recorded date, or blank spots on data sheets can make it difficult to use and the data.

- **What will we do if we do not have information to record in a certain spot on our data sheets?** Instruct students to record the number 0, mark N/A, or note other reasons for no data collected.
Macroinvertebrates cont.

6. Discuss what it means to be a tolerant versus an intolerant macroinvertebrate species. Some macroinvertebrates are able to handle pollution better than others.

Hand out macroinvertebrate data sheets. Ask students to sort their macroinvertebrate cards by tolerance level and record them on their data sheets. What does the water quality rating tell you about the health of the stream?

8. Discuss the importance of recording readable data. Have them review their sheets and see how they did.

**Part 3: Getting Comfortable with the StreamWebs website**

1. Show students how to log into StreamWebs and share the username and password with students. *We recommend one class account that students share, as it is easier to manage.*

2. Have students visit the site page where they will be collecting data during your class field trip(s).

3. Show students how they will go about entering water quality and macroinvertebrate data into the website after their field trip. Have them make note of the importance of having complete data sheets. Are their data sheets missing any important information?

4. Give students time to explore the website and look at what other schools are doing and the data that they have collected.

**Activity Wrap Up:**

Review with students what tools they are going to use to investigate their watershed. Now that they have practiced using sampling equipment and data sheets and learned more about what data they will be collecting they are ready for the field! Go over any need to know information for your upcoming field day (what to bring or not bring, appropriate clothing, boots, etc.).
Lesson 3

Timeframe
As many trips as possible to your class' site

Materials
- Field equipment - available for checkout
- Water Quality and/or Macroinvertebrate lesson plans for the field
- Pencils
- Data sheets

Objectives
- Gather and record data
- Make observations into a field journal
- Understand the importance of water quality monitoring
- Learn the appropriate techniques to sample water quality
- Perform in stream water quality tests measuring for pH, turbidity, temperature, and dissolved oxygen
- Understand the important role macroinvertebrates play in the aquatic ecosystem
- Collect, record numbers of, and study macroinvertebrates

Heading Into the Field

Teacher Background
For information on water quality and macroinvertebrates refer to: A Citizen's Guide to Understanding and Monitoring Lakes and Streams; [http://water.usgs.gov/edu/waterproperties.html](http://water.usgs.gov/edu/waterproperties.html); Water Quality and Macroinvertebrate Field Studies; found in “Resources” section for individual Kits: [http://seagrant.oregonstate.edu/education/streamwebs-educator-kits/streamwebs-kit-descriptions](http://seagrant.oregonstate.edu/education/streamwebs-educator-kits/streamwebs-kit-descriptions)

Description
In this lesson student will be heading out into the field to do a watershed investigation that includes collecting water quality and macroinvertebrate data. You can find lessons for leading your students in the field in around these focus areas at [www.streamwebs.org](http://www.streamwebs.org). Students should collect data that will help them to answer their investigative questions and save their data so that they can follow up back in the classroom at a later date.

Preparation
If you do not already have gear available to use, you can reserve equipment through the StreamWebs program that you need to carry out your field day. To reserve a StreamWebs Educator kit go to [http://seagrant.oregonstate.edu/streamwebs/kits](http://seagrant.oregonstate.edu/streamwebs/kits). Make sure to reserve kits at least 2 weeks in advance. You will also need to make sure that students have their data sheets, and remind them to be thinking about their investigative question while gathering data.

Visit the site ahead of time in order to determine safe spaces for students to work, and to determine boundaries. Each group will need to access appropriate spaces in the field to collect their necessary data. Create and share a site schedule, and field day plans with students ahead of time. Arrange for parent, partner, or community volunteers to help with the trip.
Activity Introduction

Have students gather in a predetermined spot such as an open area in a field, or by the bus in the parking lot to orient them to the space, and to reiterate the day’s activities, procedures, and schedule. Once students are gathered ask them to group with their field team. Discuss:

- Instruct students to be aware and careful while conducting their activities.
- Choose access sites to the stream or water that will cause the least disturbance, especially considering erosion of stream banks.
- Remind students to be respectful of nature (do not remove plants, handle organisms carefully and return them as close to the location they were found as possible, etc.).
- Remind students to make good observations and to record.
- Remind students to take pictures and/or video for final projects.

Please see the water quality and macroinvertebrate lesson plan links under supplies for more information on field activities, and data gathering techniques.

Activity

1. Students will work within field teams to gather data using StreamWebs water quality and macroinvertebrate tools and data sheets. The goal for students should be to gather information that pertains to their investigative question in order to attempt to answer it, and have data for their final presentations in Lesson 7.

2. Remind student groups studying and collecting macroinvertebrate data to be sure to gather species from different habitats, such as pools and riffles if possible.
Activity cont.

3. Remind teams to safely store their data sheets until their return to the classroom. Or collect data sheets at the end of the trip.

4. For each field event students should enter their data into StreamWebs as soon as possible so that it will be available for interpretation, data analysis, and presentations.

Activity Wrap Up:

When students are done collecting their field data discuss what they found. Let them know that they are going to follow up with the data back in the classroom to get a better idea of the health of the watershed. If you are planning to visit the site again you can let them know this and discuss how more data will provide them with a better picture of what is going on in the watershed.
Lesson 4

**Following Up with Field Data**

**Teacher Background**

Scientists collect and use data for a variety of reasons. Often times watershed data is collected and analyzed to monitor water quality, certain species, and relationships over time to track the health of a watershed, and how it might affect the communities’ health, land usage and building projects’ affects on the stream, future plans for the land, and the overall care of that watershed.

Discussions with students will include the idea that other project sites may have many similarities and many differences. For example, they may have more or less tree coverage to help keep the stream cool, add more or less debris in the stream, and/or to affect bank stability and erosion. The general watershed location, conditions, and how the land is used greatly affect the stream.

**Description**

In this lesson students will work back in the classroom with their field data to specifically learn how to read data, enter it into a spreadsheet, or database such as StreamWebs, and to begin to build data analysis and interpretation skills that allow them to explain and share their data with their community. Students will answer questions concerning their field experience, about their data, and begin to consider what this data might tell them about their stream or body of water. Students will also use StreamWebs to compare their data to other students’ data and project findings.

**Timeframe**

1-3 Fifty minute class periods, depending on activities completed

**Materials**

- Completed StreamWebs data sheets or example student data sheets (included)
- Computer and projector; ipads or additional computers for students (optional)
- Extra water quality and macroinvertebrate field data sheets for each team
- Water quality parameter sheets (included)
- StreamWebs’ login information (optional)

**Objectives**

- Learn how to organize and input raw data into the StreamWebs database
- Recognize and discuss any data or equipment issues
- Answer questions about their data
- Compare their own data to another site chosen on StreamWebs
- Consider variability within data typical of complex systems such as watersheds
- Examine and analyze trends and relationships in water quality and macroinvertebrate data
Preparation
If you are planning to have students enter their own data you will need to:
• Write the StreamWebs username and password
• Have ipads or computers for students to use
• Have completed data sheets from field experience
If student data has already been entered into the database and you are going to be reviewing it with students you can skip that section of Activity 1 but still have them review and discuss data sheets (example student sheets included if needed).

Students will compare their findings to another project site data within the StreamWebs database. If you don’t have another project site in mind refer to “Getting to Know StreamWebs” at the beginning of the unit for suggestions.

Activity Introduction
Tell students that they will begin to understand the story that their data tells them while working to answer questions similar to those that professionals and other stakeholders may use to better understand watershed health. Discuss:
• Getting out into the field and introduced to how scientists collect, record, and store data was an important first step in understanding our watershed, and becoming stewards of our natural resources.
• The second step is to make sure that data entered into StreamWebs, or another database for safekeeping, and to share with others.
• The third step is to explore and analyze the data so that we can understand what it tells us about our watershed. We can also compare our data to other sites or studies’ data to determine how our watershed health compares to other types of Oregon watersheds.

Next Generation Science Standards

DISCIPLINARY CORE IDEAS:
LS2.A: Interdependent Relationships in Ecosystems

PERFORMANCE EXPECTATIONS:
MS-LS2-1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.
MS-LS2-2. Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

PRACTICES:
Practice 4: Analyzing and interpreting data
Part 1: Reviewing/Entering field data

1. Group students into their previous research teams or groups of 4-6.

2. Pose the following questions one at a time giving students time to discuss with their group and then share out:
   - What problems did you encounter collecting the data in the field? Problems with tools, group dynamics, recording proper information, recording information neatly.
   - What went well while collecting data in the field? Enjoyed using the tools, good teamwork, recording proper information, recording information neatly, discovered new information or questions in regards to their study.

3. Provide students with data sheets from their field experience or example student data sheets provided. If students are going to enter their own data remind them that though many of them may have recorded data, they will only enter data recorded by just a single member (unless they were sampling at different times/places).

4. Have students login to www.streamwebs.org with class username and password. Students can login as a team on tablets or computers, and take turns reading and entering their data (if students aren’t entering data skip to #6).
   - Direct students to the project site where you collected data.
   - Demonstrate for students how to enter their data into the class StreamWebs webpage.
   - Ask students to enter their team’s data into the class StreamWebs project site.

5. Pose the following questions one at a time giving students time to discuss with their group and then share out:
   - Did you have problems reading your data sheets?
   - Were your field data sheets organized well, filled out completely, and information recorded neatly?
   - Were you missing any data?
   - How did/would that affect entering the data into StreamWebs?
3. Introduce students to the StreamWebs graphing function (if students aren’t working on ipads/computers demonstrate on projector). Point out to students that they need to enter the date range at the bottom of the page. Have students practice (or demonstrate) making 3-4 different graphs with their data in StreamWebs. Look at each parameter 1 at a time and have students use their water quality parameter sheets to determine whether it was in a healthy range.

4. Ask students to consider any interesting data that they see on their graphs. For example, are there any really high or low data points? What might have caused these points to be so different.

5. Have students look at two parameters together (i.e. temperature and dissolved oxygen) and discuss what sort of relationships they saw or what they learned from their graphs. Dissolved oxygen levels went up with cooler water, weather may affect results such as turbidity levels may be higher on a rainy day, etc.

If time allows, have students draw the graphs that they create using StreamWebs so that they may compare them to other graphs later on.

Part 3: Comparing Your Data:

1. Have students compare their data to other data in StreamWebs such as a site different than yours (rural, urban, coastal, mountains, forest).

2. Assign one or two different StreamWebs study sites to each team (or choose one to look at as a class).

3. Have students make and record predictions about how our data might compare to the other site. Have students consider:
   - Which study site more urban or rural?
   - How does being more urban or rural affect a stream?

4. Have students compare their data to that of another site making sure to notice what time of year the comparison data was taken in regards to when their own data was taken.

Guiding Questions

Water Quality

- What was the lowest water temperature recorded? The highest? Is this data in line with what you would expect to see? What factors might have influenced these results? Repeat questions for each parameter.
- How might water temperature influence dissolved oxygen? Does dissolved oxygen levels go up or down in cooler water?
- What sort of human activities might affect pH and turbidity? Hint: think about ways that individuals, businesses, and other organizations use the land and water within a watershed, and how this might affect the stream.

Macroinvertebrates

- What percentage of tolerant, intolerant, and somewhat tolerant species did you find?
- Using the macroinvertebrate data sheet, what is the overall water quality rating?
- What might that tell you about this stream?
- What factors might have influenced the type of macroinvertebrates that you found?
- How might the type of macroinvertebrates change throughout the year at this location?
Activity Wrap Up:

- How do the water quality and macroinvertebrate data work together to inform us about the health of a stream? Higher temperatures and turbidity may lower dissolved oxygen which means certain species of macroinvertebrates may not be able to live there, high or low pH levels may cause us to see more tolerant species. Can you think of other examples?

- Can our data help us answer our class/team’s question (i.e. is X creek healthy?)? Would you need to collect more data in order to answer your question? If so, what kind of data would you collect? Do you need to revise your original question?

- If we looked at our site over time, how might our data change? For example, if there was heavy rainfall in April how might it affect/change our data? The rainfall may bring more pollution from run-off in the streets or chemicals from agricultural land as it flows into the local stream, this may affect turbidity, pollution levels, temperature, and dissolved oxygen levels; there might also be higher levels of tolerant species recorded because intolerant species may die off, or move if they are able to swim, or even fly away if they have hatched into their adult stage).

- Do we have enough data to make some assumptions about how our body of water might affect the greater watershed?

Guiding Questions

Comparing Data

- How is this site’s data similar or different to your own?
- How much data did they collect? More or less than your team? How does this affect what you can learn from their data?
- How does this stream compare to your own stream? Is your stream urban or rural?
- What is the overall water quality rating compared to your own stream (this is based on the rating found on the macroinvertebrate data sheet(s))?
- How might being an urban or rural stream affect the overall water quality rating?
Lesson 5

Analyze, Interpret, and Graph Field Data

Teacher Background

Understanding the meaning of the word data, how to graph, interpret, and use data can be very overwhelming to students. Helping students understand that data is simply information, that can be many things depending upon what we are studying, or how we are using data is an important first step. Data changes per project and is based upon the objective of your own goals. Data is evidence of a certain thing, change, idea, preference, or quantity and is often measured over time, especially for accumulated data. By helping our students feel more comfortable using data and learning about graphs, and how to make them, we are setting students up to be successful in the future by giving them transferrable skills.

In this lesson students will consider independent and dependent variables. Independent is the variable, or part of the data that changes, and that can be controlled or manipulated by the scientist, or any other user of data. This variable should be placed on the horizontal or x-axis, or represent the outside circle, or slices of the pie chart. This variable stands alone and cannot be affected by the other variable being measured. For example, someone's age, or time will not be affected by the dependent variable such as how much time one spends on FaceBook, watching television, or playing guitar. However, someone's age may affect how much time they spend on FaceBook, watching television, or playing guitar. We are often trying to see if there is a relationship between variables, and if the independent variable possibly changes or affects the dependent variable.

Objectives

- Construct graphs illustrating relationships within their data
- Analyze data to determine the health of the stream
- Discuss how this data and the possible relationships may or may not help answer students’ investigative questions
- Identify areas where they might need to follow up and gather more data in order to better answer their investigative question
Dependent is the variable directly affected by the independent variable. It is the result of what happens because of the independent variable, in other words, it depends on the other variables or factors. This variable is placed on the vertical or y-axis, or represents how big the sizes of the pieces are (usually percentages) of a pie chart. The pieces should be drawn out using radial lines from the center to the outside of the circle (much like the spokes on a bicycle wheel). This variable can change based upon the independent variable. For example, a test score may depend upon other factors like how much you slept or studied beforehand, making it a dependent variable.

Description

In this lesson students will work on their data interpretation and visualization skills, and make their own graphs of their data. They will attempt to use their data to answer their question and/or discuss what additional data they would need in order to answer their question. If students did not develop an investigative question you can pose one to them such as, “Is x creek healthy for the organisms who live there?” Students will create materials for their final presentation products that explain their findings and begin thinking about an audience to share their findings with.

Preparation

If your class needs an introduction to graphing or a refresher, prepare to teach the lesson “Intro to Graphing”. Students will need to access their data (off of their data sheets or in the StreamWebs database) and have access to laptops or tablets and Excel if they will make graphs with it. Students will reassemble in their field teams with all of their data and findings to work together.

Next Generation Science Standards

**DISCIPLINARY CORE IDEAS:**

**LS2.A:** Interdependent Relationships in Ecosystems

**PERFORMANCE EXPECTATIONS:**

**MS-LS2-1.** Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

**MS-LS2-2.** Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

**PRACTICES:**

**Practice 4:** Analyzing and interpreting data

**Practice 5:** Using mathematics and computational thinking
Activity Introduction

Let students know that they will be working in their field teams to construct graphs, tables, and written materials to interpret and share their data. Inform teams they are going to examine their data, decide how to best graph it, and then make 2-3 graphs to represent their data. Students will also create tables, paragraphs, maps, or even cartoons to best present their data. It is important that students understand that it is okay if they do not have an answer to their investigative question, as long as they talk about what they did find, notice, and infer from their data.

Discuss the following guidelines for creating graphs with students:

- Choose correct colors for data visualization and representation. *i.e. easy to see and align with what people may already consider in relation to a color such as red for hot and blue for cold.*

- All graphs should be about a third to a half of a page so that information and data points can be located on them clearly and accurately.

- The scales should be selected so the data points fill the graph space.

- The graph must have a title and the axes should be clearly labeled.

- The quantity and units must be shown for each axis.

- Consider independent and dependent variables *i.e. independent variable might be time and dependent variable might be water quality parameters such as temperature, dissolved oxygen, or types of macroinvertebrates.*

- Data points should be recorded with a clear dot or easy to see symbol, or bars and/or pie wedges should be clearly drawn with separate colors.

- Appropriate and best graphs chosen for specific data: line graph, bar graph, pie chart (see Intro to Graphing lesson).

Guiding Questions

- What might data tell us about our site? *watershed health, whether or not our stream can support macroinvertebrates, fish, and other aquatic organisms, provide clues to problems in our watershed such as pollution, too little trees and plants for coverage, problems with food sources, and cooling, or other issues.*

- How can graphs act as a tool to demonstrate these relationships? *consider our information, what we are trying to share or demonstrate with our graph, what the variables are, etc.*
Activity: Analyzing & Interpreting Data

1. Group students into their previous field teams. They will need access to their data in StreamWebs or their original data sheets.

2. Handout or project the “Graphing Overview” and “5 Key Components of Any Graph” sheets for students to reference.

3. Instruct students to revisit their investigative question and discuss what they are trying to show or share in relation to their question. They will want to make some conclusions or correlations from their data in order to answer their investigative question(s). Have teams briefly discuss their data & brainstorm what type of graphs or tables they will use to demonstrate this information.

4. Ask each team to identify their independent and dependent variables for each data set they plan to graph in order to answer their investigative question, which axis each variable will go on, and their scale. Have each team share with the class or individually with the teacher to ensure students are using proper variables, and understand the relationship between them.

5. Hand out graph paper and color pencils, and instruct students to make their graphs. When student teams are done, have them share their graphs.

Activity Wrap Up:

• Do you have the data you need to answer your investigative question?

• If not, what data do you need to collect still? Or would you collect in the future?

• Were you able to illustrate your answer(s) in the form of a graph?

• Did you discover any new relationships or information while you were graphing your answers to your investigative question(s)?

• How strong is your scientific evidence? How do you know?

  Stress to students that even if they don’t have the data they need to answer their question, they can still present what they do have and explain their findings, what they still need, and/or any changes to their investigation plan.
A Graphing Overview

Line graphs:
- Often used to show how something changes over time
- The x-axis (horizontal line) has the data for the time period (months, days, or time)
- The y-axis (vertical line) has the data for things being measured

Bar graphs:
- Often used to represent categorical data
- The x-axis (horizontal line) represents the categories that are being measured
- The y-axis (vertical line) represents the amount of the information/data being measured
- Sometimes they may display data that has nothing to do with time
- Macroinvertebrate data is easily shown in a bar graph, where each bar is a different macroinvertebrate and the height of the bar represents the number of each species that were found.

Pie Chart/graphs:
- Useful for showing percentages, or portions of a whole
- They show data at a certain, and set point in time, and are not used to show information over time

Advice on Creating Maps:
- All graphs should be big enough, (for example, half of a piece of 8.5x11 page) so that information and data points can be located on them clearly and accurately.
- The quantity and units must be labeled for each axis, bar, or pie piece.
- Data points, bars, or pie pieces should be recorded, or drawn with a clear dot, bar or easy to see symbol. Depending upon what the graph represents and who it is being prepared for, symbols may be used instead of simple plotting dots.

For example, for our StreamWebs data we may use fish to represent our data, and draw them stacked upon each other to represent each bar.
- Choosing correct colors for data visualization and representation is another important step. Choose colors that are easy to see and are representative of categories in data (e.g. red symbolizing hot and blue symbolizing cold).
Five Key Components of Any Graph

1. The Title
   - Explains concisely what the graph is about
   - Should give the reader an idea about what they will see or learn about in the graph
   - Placed above the graph

2. The Independent Variable
   - The data that changes and can be controlled or manipulated by the scientist, or any other user of data
   - Represented along the horizontal or x-axis, or the outside circle, or slices of the pie chart
   - This variable stands alone and cannot be changed by the other variable being measured
   - Graphs are often used to observe if the independent variable possibly changes or affects the dependent variable

3. The Dependent Variable
   - The variable directly affected by the independent variable
   - Represented along the vertical or y-axis, or by how big the sizes of the pieces are (usually percentages) of a pie chart
   - This variable stands alone and cannot be changed by the other variable being measured
   - Graphs are often used to observe what defines how a dependent variable changes when we graph data.

4. The Scales for Each Variable
   - Guides where we plot the points, or symbols, representing the data when we construct our graph
   - Designed to include all the data points and fill the graph space as much as possible
   - Each space or mark in the scale should have a consistent and standard increase in amount, or increment, on a particular axis

5. The Legend
   - Short description concerning the graph’s data
   - Tells the reader what they are looking at, including symbology, color scheme, or lines on graph
   - Short, concise and placed directly under or beside the graph.
Sharing Your Field Project

Teacher Background

Student projects produce real results and an important part of the learning experience is to celebrating their contributions and demonstrate what they have learned to others. This lesson will help students prepare to tell your project story to the community. Not only does the community want to hear about the goals and outcomes of the project, it is important to compile project information into a complete and final package that makes sense to your students.

Students should compile data and create the story of their project. It's important to consider the multiple ways of telling the story of the project - synthesizing and analyzing the data is simply one piece of a compelling story. Remember to have students utilize all of their project team skills and talents to include creative arts, natural history, technology and community components in their watershed story. Their story should capture information about the investigative question they chose, hypothesis they tested, methodology they used and conclusions they were able to draw.

Description

In this final activity students will develop their communication and presentation skills. This is also the class' opportunity to share their findings with stakeholders, the school, and the community. You will want to help students tie this back to the community needs discovered and the work they did in Lesson 1, so that it is a meaningful presentation for your particular audience.
Preparation

Ideally you will plan or take part in an event where students can share their projects with their community, the partner or stakeholder you worked with, and their school. This could be done at a family math and science night, science fair, at a partner organization’s board meeting or community night, or you may want to create a special event for your class at the school. Be sure to invite families, partner organizations, stakeholders, other teachers and school staff, community members, etc. and if possible include students in the planning process. Other ideas for sharing projects include working with local watershed council or other partners to showcase them at a meeting or event, hanging up posters in their building to share with the public, showcase students’ posters at the school. Articles, videos, and pictures can (and should be!) be uploaded to StreamWebs, school and partner websites, or to wikispaces.

Activity Introduction

Let students know that an important part of doing science is sharing results with your community, the watershed council you may have worked with, and any other potential stakeholders via products such as: a report, poster, article, video, song, or a combination of these products that answers the project’s overall investigative question(s), and showcases the results.

- Who are our stakeholders? individual people, a group, business, or an organization with an interest in your project, such as: your school, watershed council, state park, or any other partners you will be sharing information with.

- What will we share with our stakeholders? our data collected; our results and findings from analyzing our data; information regarding our research; answers to our investigative questions; other questions that came out of our research; any recommendations that we have.

Next Generation Science Standards

DISCIPLINARY CORE IDEAS:

LS2.A: Interdependent Relationships in Ecosystems
LS2.C: Ecosystem Dynamics, Functioning, and Resilience

PERFORMANCE EXPECTATIONS:

MS–LS2–1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

MS–LS2–2. Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

MS–ESS3–3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.

PRACTICES:

Practice 1: Asking Questions and Defining Problems
Practice 3: Planning and Carrying out Investigations
Practice 4: Analyzing and interpreting data
Practice 6: Constructing explanations and designing solutions
Practice 7: Engaging in argument from evidence
Practice 8: Obtaining, evaluating, and communicating information
**Activity:**

1. Divide students back into their field investigation teams. Instruct students that they are going to continue to build upon their answer to their investigative question(s).

2. Give students a few minutes to get their investigative question(s), graphs, data, and other information gathered and ready to use.

3. Give students time to refine graphs, tables, or other forms of data interpretations they may need to answer their investigative question.

4. Explain to students that they are going to build an argument using their data as evidence to defend their answers to their investigative question(s). Students need to refer back to their investigation plan, tools used, the data found, and make a plan to provide the best evidence they have to support their conclusions and claims. Data is not evidence until used in the process of supporting a claim!

5. To help students get started have them free write two or three paragraphs sharing what they found during their field investigations. Tell them to start with their investigative question, and attempt to answer it by referring to and analyzing the data in order to explain and defend their answers.

6. Have each team share and then combine the best parts of their paragraphs to create a draft of a written piece to be included in their final presentation.

7. Have students attempt to fill in the sentences, “____ indicates that ____” or “evidence from ____ indicates that ____”.

8. Go over any guidelines or presentation elements that you would like students to include. Have students brainstorm what kind of presentation that they would like to create and how they might share it. **We encourage you to upload your projects onto project page in the StreamWebs database as one avenue of sharing!**

**Guiding Questions**

- **HOW** do I plan to share my project and make the sharing successful?

- **WHO** will I share my project with? City council members, school board, watershed council, school paper, local businesses, family and friends, agency partners, other?

- **WHAT** resources do I need to compile/create my presentation? PowerPoint, maps, data sheets, excel, other?

- **WHERE** and **WHEN** will I share my project?
9. Give students plenty of time to create their team’s presentation. Remind them that the idea is to share what they learned from their field project in a creative way with stakeholders or an interested audience, such as the watershed council or state park that you may have worked with on your project. Students may also be able to share their findings at a family math and science night, or through another school event.

**Activity Wrap Up:**

When students are done with their final presentation have each group present them to the class. This should be practice for sharing with the broader community!

If you plan to follow-up your field investigation with a stewardship project use the StreamWebs Stewardship 101 planning sheet as a guide to planning a stewardship project with students!
StreamWebs Stewardship projects can be as big or small as you want them to be! The goals of a StreamWebs Stewardship project are to engage students in a meaningful watershed experience that is hands-on and community-oriented, integrated into classroom learning, increases awareness and knowledge of important environmental issues such as invasive species, and leads to actions that improve and/or restore the watershed.

**Step 1: Needs Assessment**

This step will help you launch your investigation into developing a project idea. First and foremost, spend a moment brainstorming about the things you find interesting. How would you like to approach the project? What inspires you about the natural world? What types of learning activities are you most drawn to? Writing? Art? Science? Outdoor exploration? Consider the way you best connect to the natural world as you assess what the ecological and educational needs are for your project.

**Step 2: Identify Community Partners**

This is your opportunity to reach out into the wider community to tell others about your project idea, get them excited and involved! This step will help move you into action.

1. Identify and contact professionals and specialists you may want to get involved with your project.
2. Establish the contributions and responsibilities agreed upon by both parties as you enlist community professionals to help you with your project.

**Step 3: Organize and Plan Your Project**

Brainstorm a project that most interests you and your students and allows students to explore their local environment through exciting, creative and inquiry driven investigations. Project ideas include:

- **Field Research** – conduct field research to determine the health of a stream or overall health of the watershed – this can include parameters such as chemical water quality testing, macroinvertebrate sampling, plant identification and in-stream habitat assessments

- **Stream Restoration Projects** – remove invasive species and/or plant native plants to restore
healthy function of the riparian zone.

- Photography – photograph something that interests and inspires you in your local watershed and share your photos with the community.
- Photo-point Monitoring – monitor the progress of a stream restoration site over time through taking specific photographs at identified priority locations.
- Videography – create a video that traces the path of the water from the headwaters to the confluence
- Journalism – report about a local restoration project or need within the watershed
- Art – develop a creative art project such as a mural to portray the life of a stream over time, depicting the watershed and each of the components within it or the lifecycle of salmon
- Mapping – create a map of the stream pre and/or post restoration work or create a three-dimensional map of the watershed.
- Creative Writing – share something that interests and inspires you about your local watershed through creative writing.

**Step 4: Implement Project**

This is where you put your project plan into action. Make sure to plan field days in advance and coordinate with project partners who can support students in the field. Streamwebs.org has a number of resources that can help support the implementation of projects including curriculum, datasheets, and field gear.

**Step 5: Reflection and Evaluation**

This valuable step will help you weave it all together. Each and every student will experience their project in unique and special ways. It is important to have students take some time to document their own project perspective and jot down their streamside thoughts and river reflections. Through reflection, they hit the pause button so they can make integrated connections throughout their project. Have students take a moment each day they are in the field to record a journal entry.

**Step 6: Prepare to Share**

Your project has produced real results and it is important to celebrate student contributions and for them to demonstrate what they have learned to others. This step will help them prepare to tell their Stewardship Project’s story to the community. Not only does the community want to hear about the goals, objective, and outcomes of their project, it is important for them to compile their project information into a complete and final package that makes sense to them.
Have students compile your data and create the story of their project. It’s important to consider multiple ways of telling the story of the Student Stewardship Project – synthesizing and analyzing the data is simply one piece to a compelling story. Have students remember to utilize all of their creative arts, natural history, and technology and community components in their watershed story.

**Step 7: Demonstrate and Celebrate**

It is now time to turn it up, showcase the results of your students hard work and demonstrate what was have learned to others. There are many ways to have students share their knowledge and experience with their peers and the community; here are a couple of ideas:

- Give a school or community presentation about the project
- Upload your project to streamwebs.org
- Find a student watershed summit within your community
- Take part in a city council meeting
**Dissolved Oxygen (D.O.)**

**Definition:** The amount of oxygen in the water.

**Importance:** Required by aquatic life to breathe.

**How is it measured?** In Parts Per Million (PPM).

*(some scientists use mg/l or percent saturation)*

### Dissolved Oxygen (PPM)

- **0** to **2**: Mosquito larvae
- **3** to **6**: Salmon eggs and young
- **7** to **13**: Mayflies/Stoneflies

© Environmental Services City of Portland  OD 0727
Temperature

Aquatic organisms breathe oxygen that is dissolved in the water.
- Warmer water may mean less dissolved oxygen is available for aquatic animals to breathe.
- Colder water can hold more dissolved oxygen.

Rapid changes in water temperature can kill aquatic organisms.

pH

Definition: Measure of how acidic or basic (alkaline) the water is.

Importance: Pollution can change the pH of water. If water is too acidic or too basic aquatic life can die.

**pH scale**

- **ACIDS**
  - 0: battery acid 0.3-1.0
  - 1: stomach acid 1-3
  - 2: lemon juice 2.3
  - 3: cola 2.6
  - 4: coffee 4.9-5.2

**Turbidity Chart**

**Turbidity:** A measure of the cloudiness of the water.

**Why is it Important?**
- Sediment can smother eggs.
- Sediment can clog the gills of fish and other stream animals making it hard for them to breathe.
- Increased turbidity can result in warmer water, leading to lower levels of dissolved oxygen.

**If you obtained a JTU measurement of . . .**

MACROINVERTEBRATE SAMPLING

Name: Group A
School: Ant-Grow Elementary
Teacher: Riley
Date: 9/17/13
Time: 10:30
Weather: Very Rainy

Stream/Site Name: Wiley Creek
Time spent sorting/identifying: 30 min

# of people sorting/identifying: 4
Rifle  Pool

Directions:
1. Record the number of each type of organism found in the # found column of each section.
2. Then circle the number in the score column (3, 2, or 1) if any of that organism was found.
3. Complete the equation at the bottom by adding up the circled numbers from each score column.
